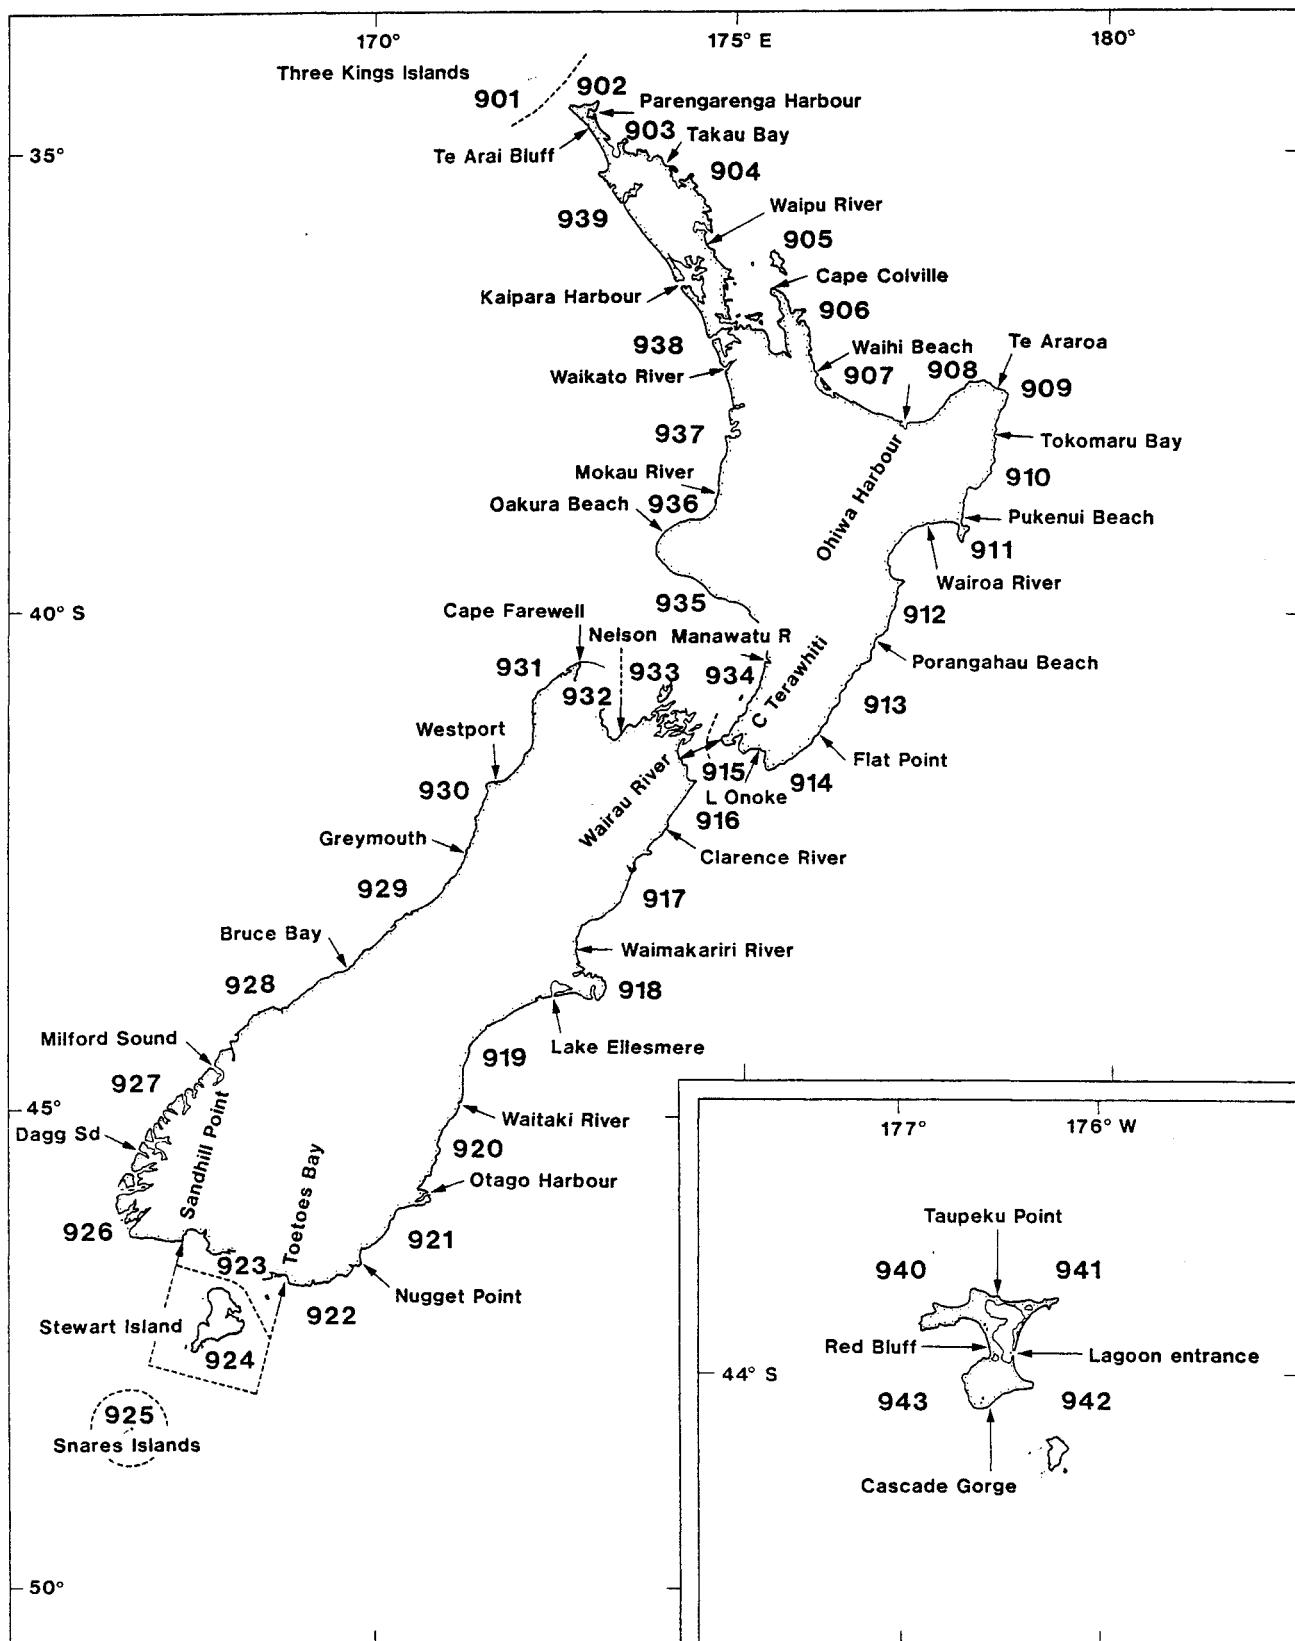

Fig. 1: Rock lobster fishing return scheme statistical areas.

## Introduction

The fishery for New Zealand's two rock lobster species is the single most important domestic fishery, with export earnings of about \$54 million f.o.b. in 1983. Landings of *Jasus edwardsii* (the red or spiny rock lobster) were recorded from Three Kings Islands to Snares Islands, from both coasts of the North and South Islands, and from Chatham Islands. *Jasus verreauxi* (the green or packhorse rock lobster) accounted for less than 1% of the total rock lobster landings, and they were taken mainly from Northland and the Bay of Plenty, the highest landings being from areas 901 and 902.

The data given here are the landings declared by commercial fishermen who use pots. Rock lobsters taken by handpicking, as a by-catch from other commercial fishing methods, and by amateurs are not recorded here.

The data are grouped primarily by area fished, so that changes in landings and catch per unit of fishing effort for each area can be monitored. Landings are also grouped by region of landing to enable comparison with data in the annual *Report on Fisheries* published by the Ministry of Agriculture and Fisheries (formerly the N.Z. Marine Department) from 1945 to 1974.

## Results

The New Zealand coastline (including the Chatham Islands) is divided into 43 statistical areas (Fig. 1) for the purposes of the rock lobster fishing return scheme. The rock lobster fishery is divided into 10 controlled fishery areas (Fig. 2), each made up of 2 or more of the statistical areas. Any differences between the boundaries of statistical areas and the corresponding controlled fishery areas are usually slight.

The rock lobster return form used in 1983 was changed slightly from the form used since 1979. To encourage fishermen to provide accurate and complete data, the minimum information consistent with effective monitoring

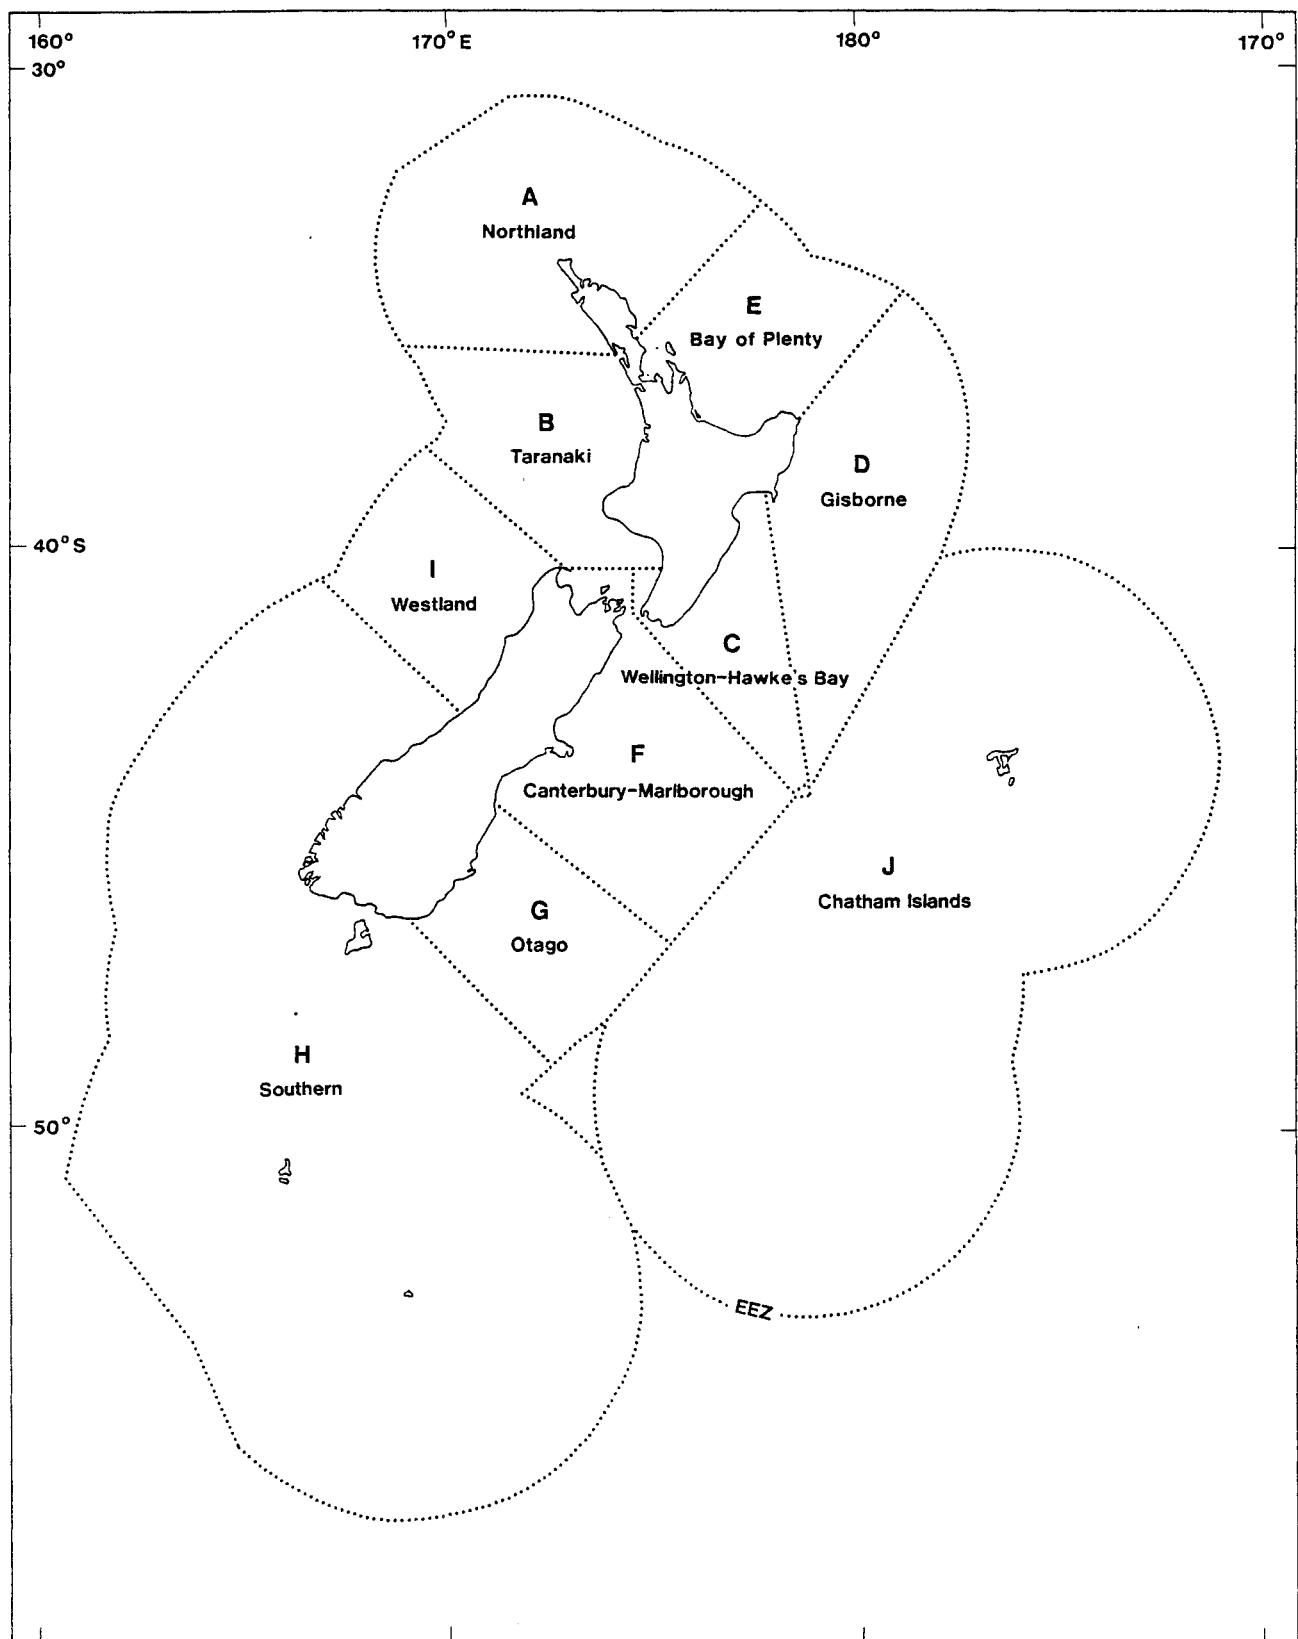

Fig. 2: Rock lobster controlled fishery areas.

of the fishery was requested. This included a monthly record of statistical areas fished, day of month fished, number of pots lifted each day, and weight of rock lobsters (whole or tail) and by-catch species landed. One additional set of information was requested; the maximum number of pots in the water at any one time during the month. The base port was no longer requested and slight changes to the layout of the form were made to improve computer data entry (and keep the forms compatible with new forms for other fishing methods).

The landed weight figures shown in the tables and figures are all whole weight values. When only tails were landed, tail weights were multiplied by three to obtain the approximate equivalent whole weights. Fishermen are permitted to tail their catch at sea and land only the tails in statistical areas 923-928 and part of area 922, which make up the Southern controlled fishery area (H). In the rest of New Zealand rock lobsters must be landed whole and alive.

Total landings of *J. edwardsii* and *J. verreauxi* are shown for the North and South Islands combined and for the Chatham Islands for each year from 1945 to 1983 in Table 1 and Fig. 3. In addition, the number of registered rock lobster vessels for each year is shown in Table 1. Before

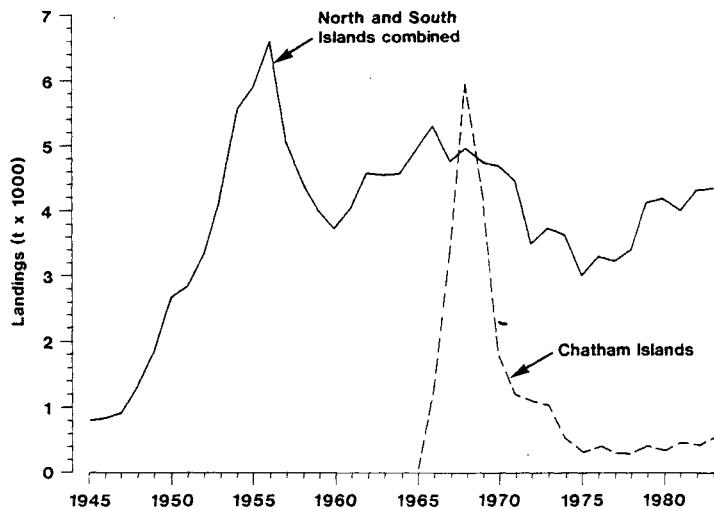

Fig. 3: Landings of *Jasus edwardsii* and *J. verreauxi* combined for North and South Islands combined and Chatham Islands during 1945-83.

the introduction of the controlled rock lobster fishery in 1980-81, the higher number of vessels included many permits that were not fully used. During 1983, returns were provided from all licensed vessels. Data for 1945-74 are from the port of landing figures in the annual Report on Fisheries. Data for 1975-78 are from unpublished figures from port of landing totals recorded by the Ministry of Agriculture and Fisheries. Data for 1979-83 are from fishing return forms submitted by rock lobster fishermen. The landings for 1983 are those declared on fishing return forms received and processed by 1 July 1984.

Landings and effort data for *J. edwardsii* for each month during 1983 for each of the statistical areas and the combined totals for all of New Zealand are shown in Table 2. These data have been grouped by controlled fishery area and are shown in Table 3. The columns in Tables 2 and 3 which present landed weight (kg) for returns with effort data include the landed weight figures for only those vessels which supplied data on number of days fished. There are some areas where landings data are from more than a single day's fishing because a few fishermen failed to mark each day fished and gave only the days landed or total landings for the month. Thus, in these areas there may be a slight under-recording of days fished. This is restricted mainly to the Southern fishery and is unlikely to have a significant effect on the estimates of catch rates. The estimated number of pot-lifts is calculated from the average of pots hauled per day fished (where numbers of pot-lifts were given) multiplied by total days fished. In addition, pot types and sizes are not standard around New Zealand and this may affect the average catch per pot-lift. The last column in Tables 2 and 3 (Total landed weight (kg) for all returns) includes the landed weight figures supplied for all vessels, including those without data on the number of days fished.

Total landings of *J. edwardsii*, effort, and landings per unit of effort are shown for each month during 1983 for all areas combined in Fig. 4. Landings and effort were highest during October-December and lowest during March-May.

Total landings of *J. verreauxi* and *J. edwardsii* combined by region of landing are shown in Table 5. Landings have been grouped into regions which correspond as closely as possible to the port of landing in the annual Report on Fisheries. As many as 40 landing points may be included in

a single region (Fig. 5). These regions or ports of landing are not good indicators of areas actually fished, especially in the south of the South Island.

The distribution of landings per vessel is shown grouped into 1-t intervals for each of the controlled fishery areas for 1983 in Fig. 6.

## Discussion

Total rock lobster landings for New Zealand remained fairly constant during 1979-81 and then increased by about 5% in 1982. The total landings for 1983 increased by about 4% over the 1982 landings. Since the licensing of the rock lobster fishery in 1980-81, there has been an improvement in the statistics supplied by fishermen and this may be reflected in the 1982 and 1983 figures. However, because returns are still being submitted without all the requested effort information there are still gaps in the data available.

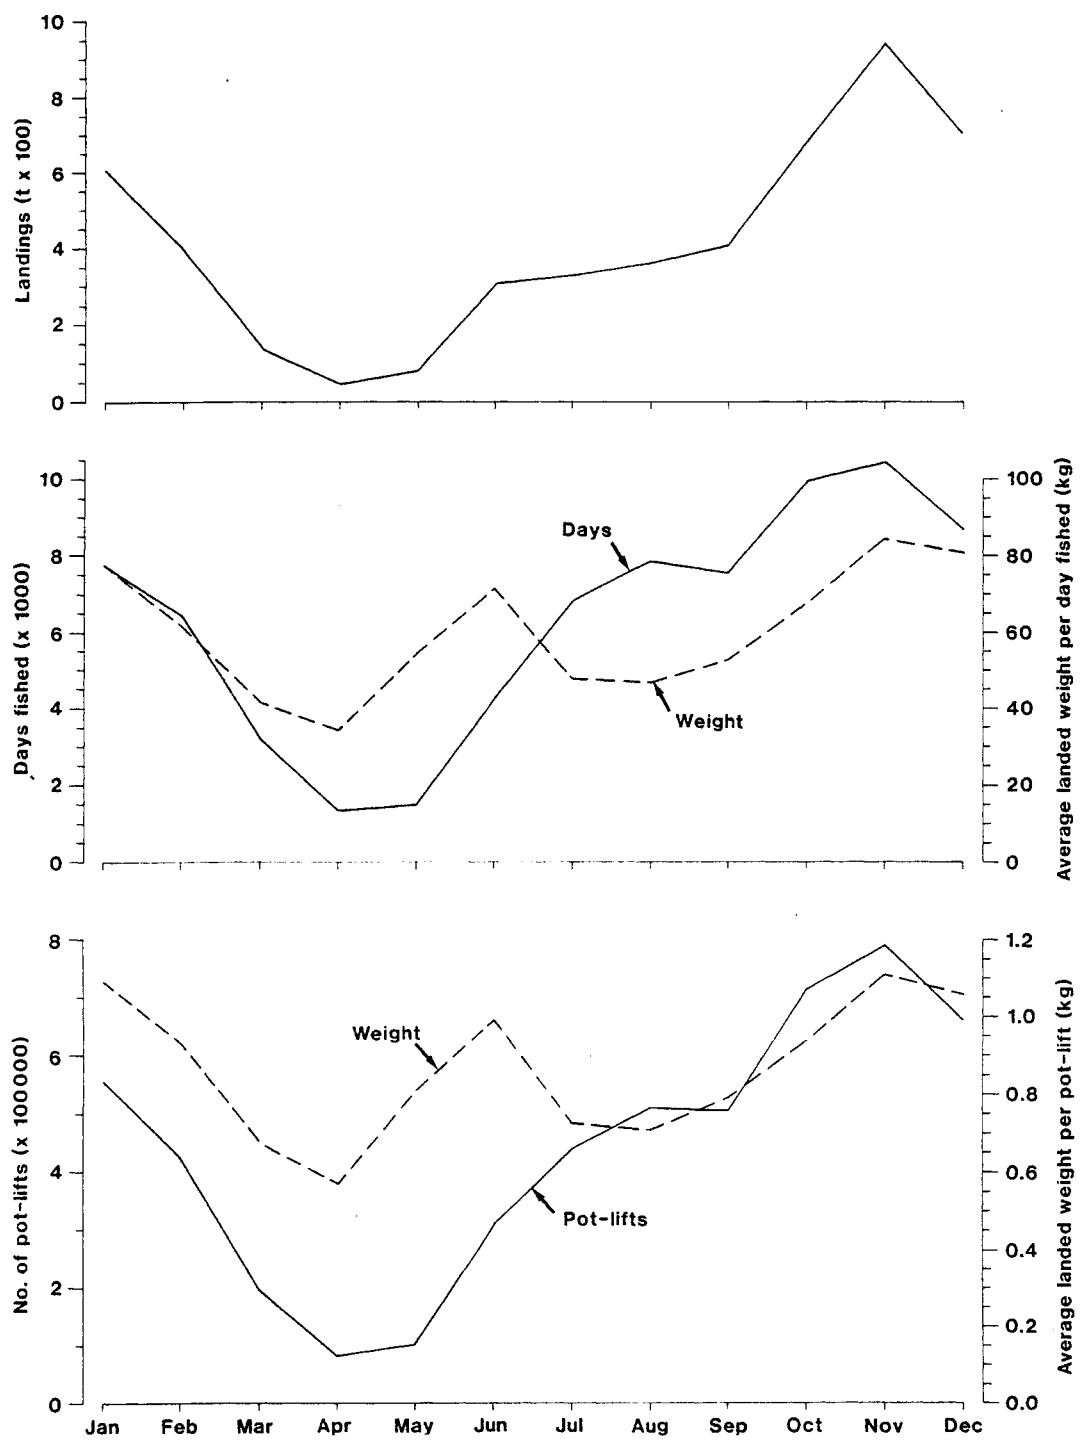

Fig. 4: Landings of *Jasus edwardsii* (whole weight), number of days fished, number of pot-lifts, average landed weight per day fished, and average landed weight per pot-lift for each month during 1983 for all areas combined.

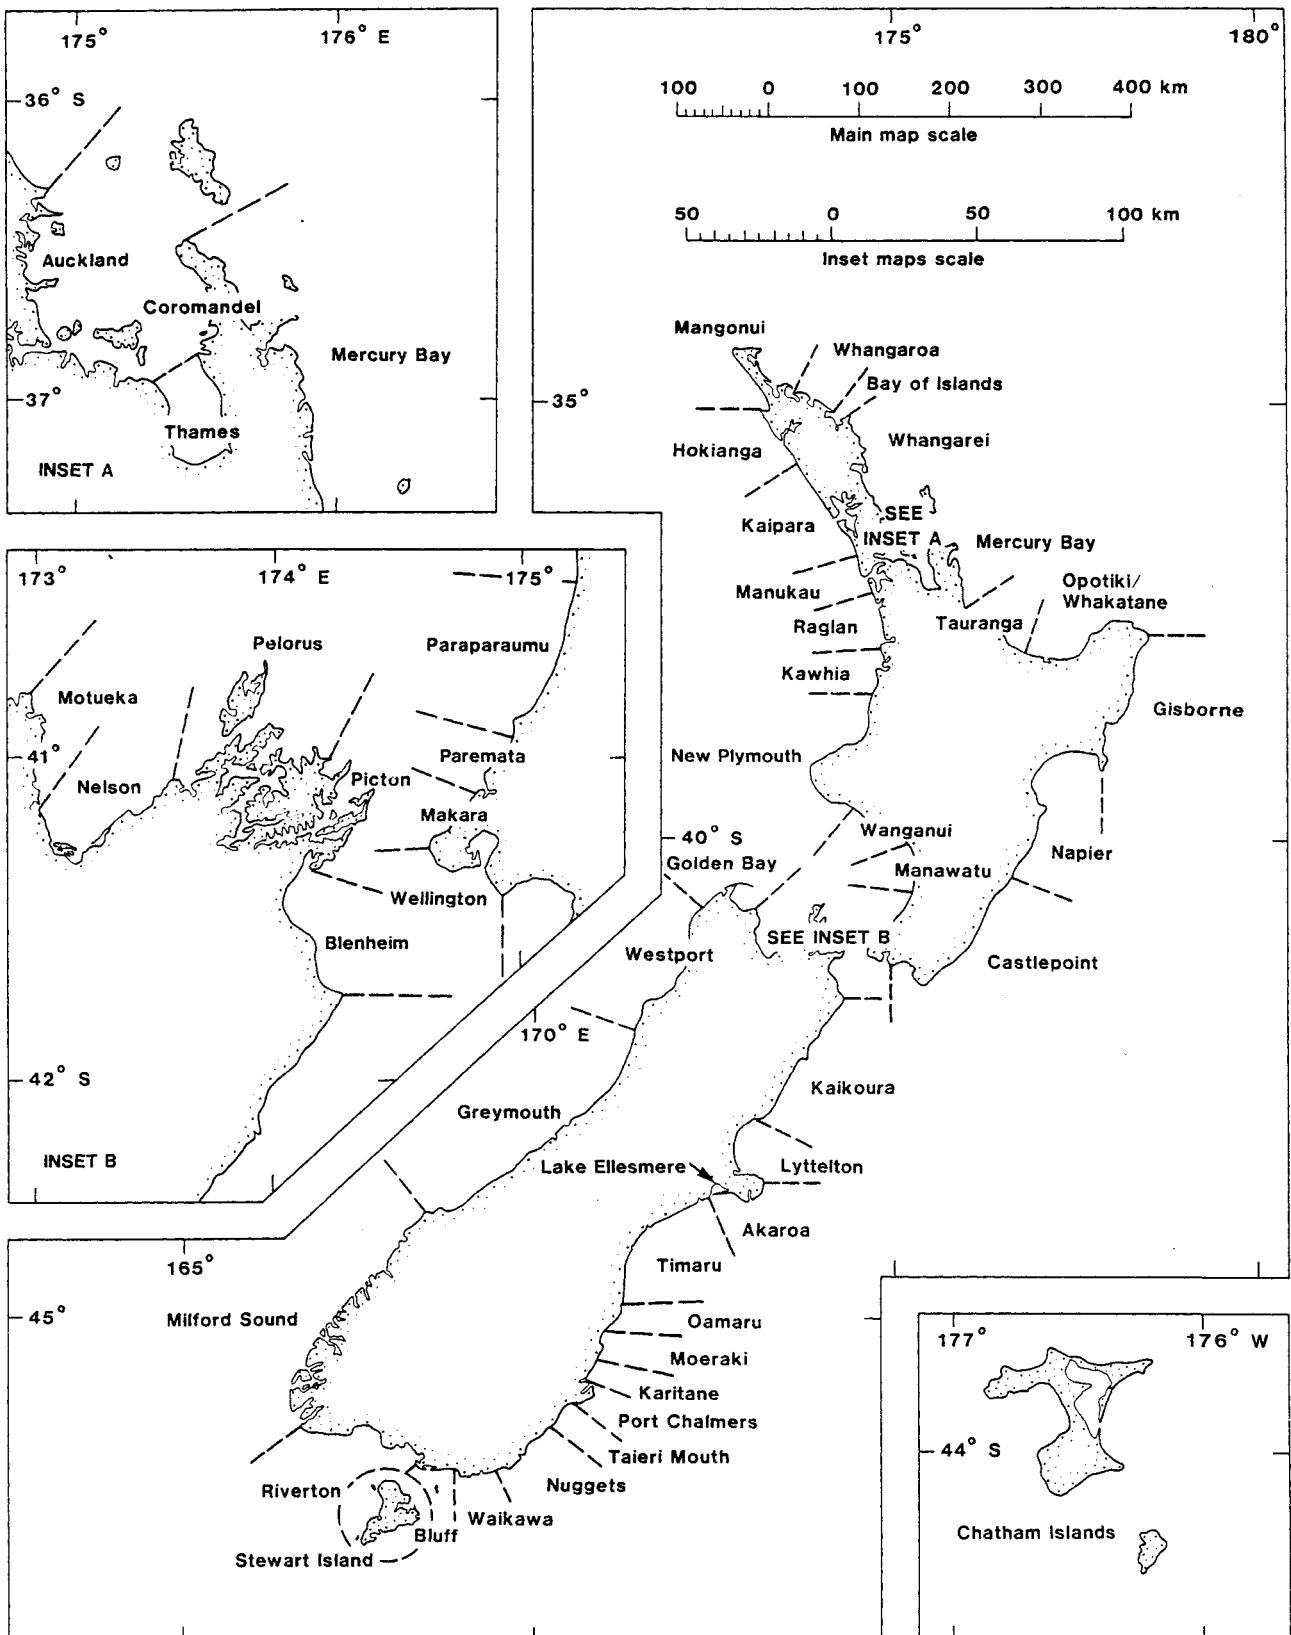

Fig. 5: Length of coastline included in each of the regions of landing shown in Table 5 .

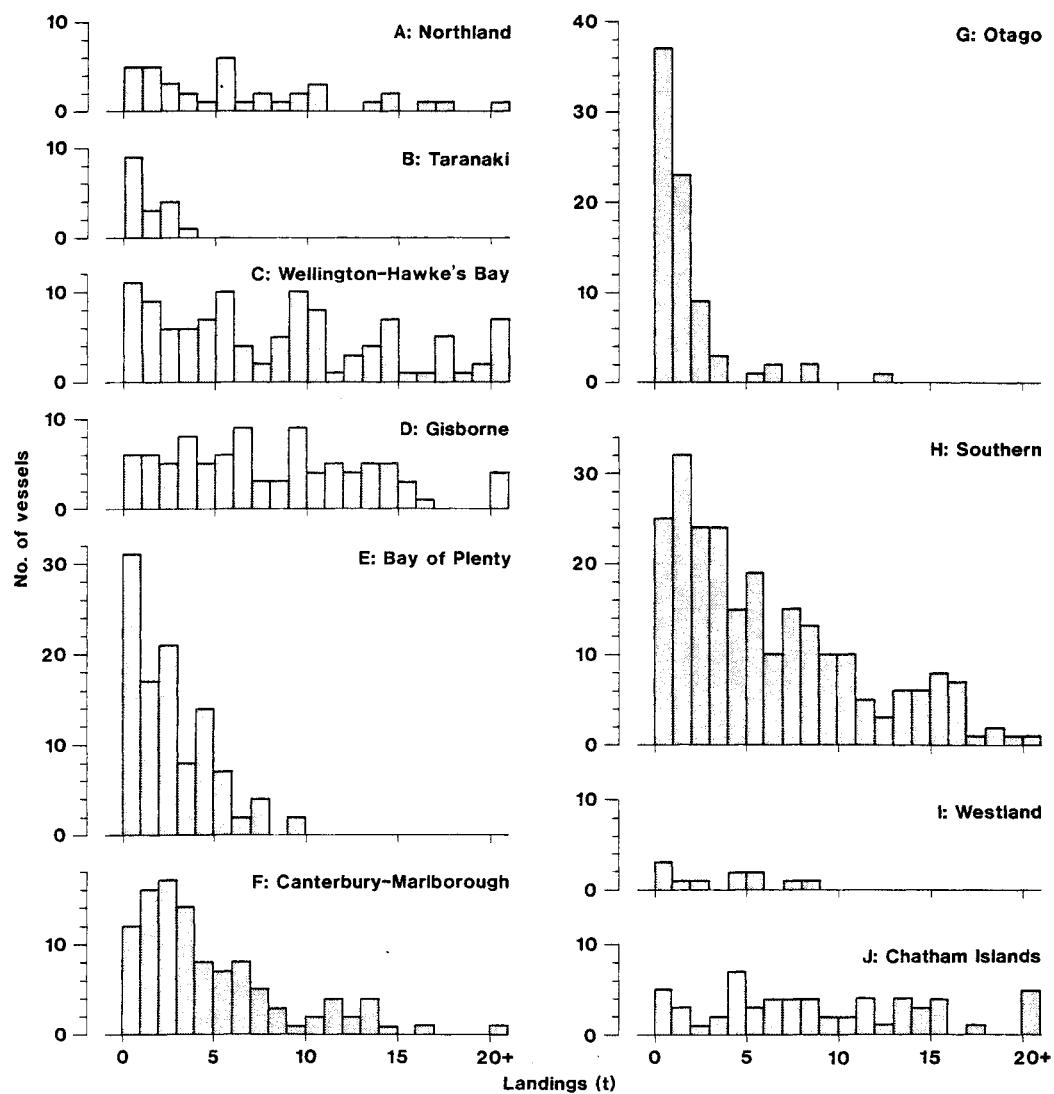

Fig. 6: Total landings of *Jasus edwardsii* per vessel for 1983 grouped into 1-t intervals for each controlled fishery area. The 0-t interval includes data from vessels which declared nil landings for the entire year.
